Artistic Combinations
which typify the
Various Periods of
Decorative Interior Design

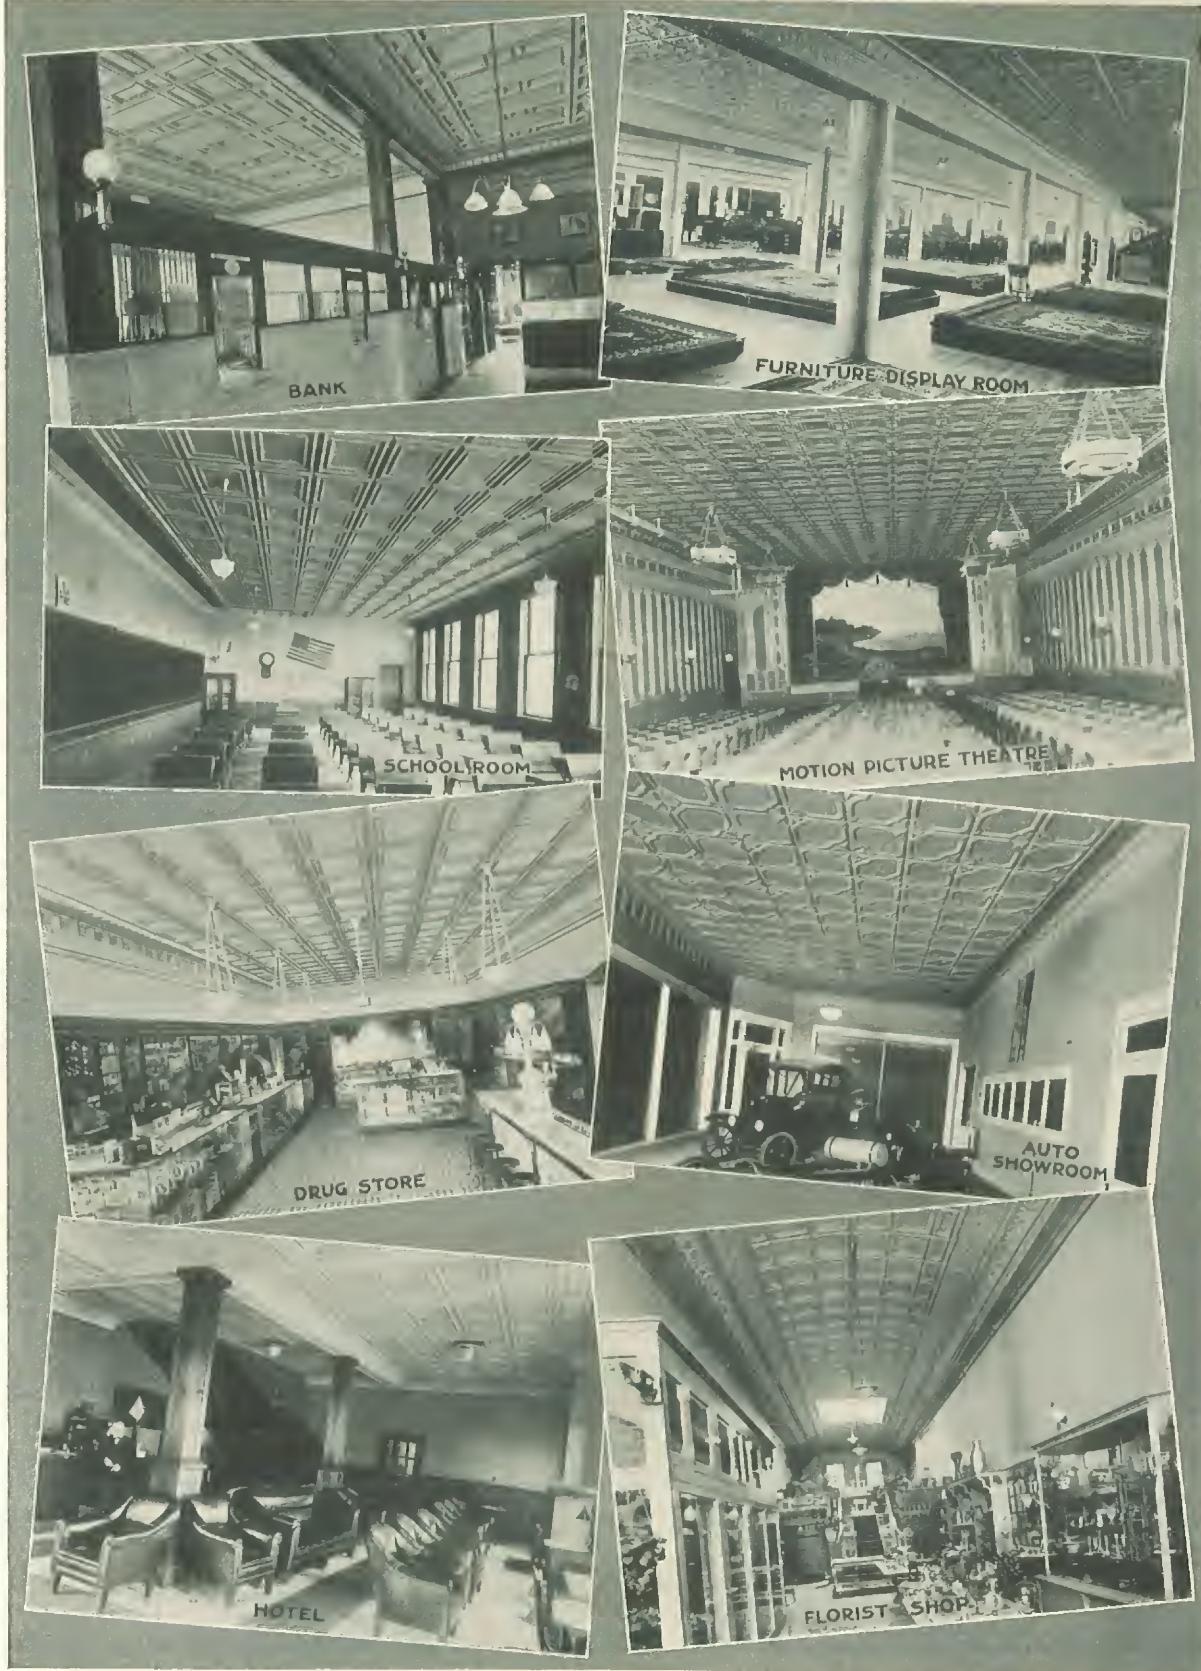

CATALOG No. 35

Many other combinations of
BORDER, FILLER, CORNICE
and FIELD PLATES
can be made to suit the taste of the
individual

At a fraction of the cost of ornamental plastering, excellent effects can now be obtained with Invisible Joint Metal Ceilings—Artistic, Firesafe and Economical.

A Few Installations Which Show the Wide Range of Adaptability of Invisible Joint Ceilings and Side Walls.

This Famous *"Invisible Joint"* Feature Has Contributed Greatly to the Success of These Metal Ceilings and Walls

Before the invention of the "Invisible Joint," it was extremely difficult, if not altogether impossible, to erect metal ceilings in a manner that would conceal the joints between the various units. It required much painstaking labor to accomplish even a fairly neat job. Erection costs were, therefore, high and most installations had a rather crude appearance.

But when the "Invisible Joint" was perfected, it was an easy matter for anyone to do better work than the best experts could do before that time. Each plate now lines up perfectly, lapping seams are automatically concealed, and the work of erection is greatly simplified because only one nail is required where the four corners of each plate overlap.

The beads are re-pressed, so that they fit snug and true. Perfect alignment and finely finished appearance are thus assured. The nail holes are die cut and accurately placed by precision machinery, so that each nail hole in the corner of any field plate, or any other unit, will match exactly in location, size and shape, the hole in the corner of any other unit of a similar design.

Then, too, the snug fit of "Invisible Joint" units eliminates the possibility of dust sifting through from the floor above, which formerly was a common objection to ordinary metal ceilings.

It is because of the precisely re-pressed beads and die-cut nail holes, that "Invisible Joint" Metal Ceilings can be erected so quickly and economically. Workmen endorse these features because they eliminate danger of bruising the fingers and because fine looking jobs invariably result—worthy of any craftsman who takes pride in his work.

"Lock-Joint" Plates also available in these Ceiling Designs

The "Lock-Joint" Ceiling Plate is another very practical type of design, especially desirable under certain conditions. Where joists are spaced on 24-inch centers, wood furring strips are not needed when "Lock-Joint" Plates are used. The illustration above shows how the lock-joint is formed.

If joists are spaced on 24-inch centers, nailing along two parallel edges of the plate is all that is required, because the lock-joint on the other two edges is sufficient without any nailing there. Erection is very simple and demands compara-

tively short time and a minimum amount of labor.

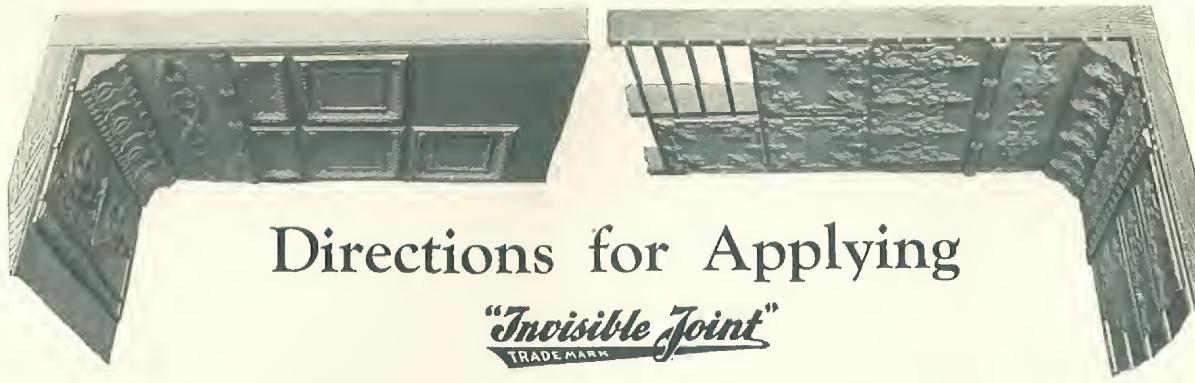

"Lock-Joint" Ceilings present a very pleasing appearance when erected. There are no nail holes or nail heads exposed—they are all covered by the lock seam. "Lock-Joint" Ceiling units fit snugly into each other and thus positively prevent any possibility of dust sifting through from the floor above.

"Lock-Joint" Ceiling Combinations are shown in this Book on Pages 24, 25 and 47.

Special Ceiling Plans

Special layouts and detailed plans for interiors for any type of building will be furnished gladly on request, without cost or obligation. We maintain an extensive organization and the most modern equipment to render service of this sort. Do not hesitate to make use of this service.

With our complete facilities for molding the original models, making the dies and producing the units in metal, we are in ideal position to furnish special designs in case none of our stock patterns suit the requirements. All special work is handled promptly and at minimum expense.

Directions for Applying "Invisible Joint" Metal Ceilings and Side Walls

A blueprint working drawing showing the arrangement of the various plates, is furnished with every ceiling. Itemized packing sheets giving quantity and catalog number and size of the material are also included.

The first thing to do when a shipment arrives is to check the number of packages with the bill of lading. The contents of each package should then be checked and counted against the packing sheet.

Check the measurements on the blueprint with the building. If any material is short in the crates, or the blueprint does not agree with the building, notify us at once before you start to erect the ceiling. After the material and blueprint are carefully checked, proceed as follows:

If possible, it is best to scaffold the whole room, but a movable scaffold may be used.

When ceiling is boarded or sheathed most of our designs can be applied directly to the sheathing. If the ceiling is plastered, wood furring strips must be used, with exception of Plate No. 1200, shown on page 48, as it is not practical to apply other designs direct to lath or plaster. It is not necessary to remove old plaster, as the wood furring strips will hold it in place. If plaster is loose, extra strips should be placed where necessary.

Follow the blueprint carefully and observe the starting point and center line. The starting point is not always on the center line. Great care must be taken to make sure that the center line is in the exact center on both ends, as well as the middle of the room. Many rooms vary on the ends, so it is best to get the exact center on each end and strike a chalk line. This should be done lengthwise as well as crosswise of the room.

Observe whether plates start on the center line or not. If not, measure the proper distance on side of center line, and if wood strips are used, center the strips on this line. You then have the starting line one way of the building. The same operations are necessary the other way of the building.

On the plan, find the location of the starter plate. Observe the exact distance from the rear wall, and then, with the location of the starting line, you are ready to apply the field plates.

Strike a chalk line for each wood strip placed, taking care that the proper distance required will fit in the center of the strip. If the strips are put six inches on center for field plates, no cross furring is necessary. If placed twenty-four inches on center, cross furring is necessary every forty-eight inches, or on the end of every plate. The next step depends on the design and style of ceiling. If the design has a border around the field plates, this should be put on next. If a molding or molded filler is used, this can be applied next to the field plate or border.

If a center ornamentation filler is used, this should be applied after the field plate is in position and before placing the mold or cornice. Care should be taken to get this filler in the exact center of the space. The cornice generally projects more than the mold, so great care must be used in striking the chalk line of the cornice and molding. The balance of the space will be covered by the center ornamentation filler.

After this the molding is applied. This makes a finish on one side of the filler. The cornice is applied last and completes the ceiling. We furnish stamped one-piece mitres for all cornices of a depth of four inches or over for right-angle corners only. All irregular mitres must be cut by the erector. We send a sufficient amount of material to make these mitres, but cannot be held responsible for any unnecessary waste of materials.

When iron girders are used in a building and are to be covered with metal ceiling, it is necessary to build woodwork around same to receive the ceiling, the construction of which will be shown on the drawing we furnish.

Ceiling plates cannot be arranged to accommodate gas and electric light drops; but all such drops must be placed to conform to our drawing and layout. Lights can be dropped from either the center or corner of the plate, which necessitates but very little change to get them to come about where they are wanted.

Side walls are easily applied. One-half inch sheathing or strips are used. If strips are used, they should be placed six or twelve inches on center.

How to Estimate Area of Ceiling

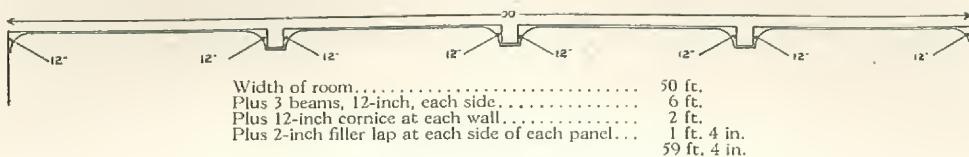

It is important to follow these instructions carefully in estimating the area of ceilings:—

Add to the length of the room the depth of the cornice plus 2 inches for filler lap on both ends or wherever used.

Multiply this by the sum of the width of the room, depth of the cornice and 2-inch filler lap where used. For example: A room 26 x 54 feet, with 12-inch cornice on sides and ends, is figured as follows: (See column to the right.)

Length.....	54 feet
Plus 12-inch cornice on two ends.....	2 feet
Plus 2-inch filler lap on two ends.....	4 inches
	56 feet 4 inches
Width.....	26 feet
Plus 12-inch cornice on two sides.....	2 feet
Plus 2-inch filler lap on two sides.....	4 inches
	28 feet 4 inches
28 feet 4 inches x 56 feet 4 inches=1596 square feet	

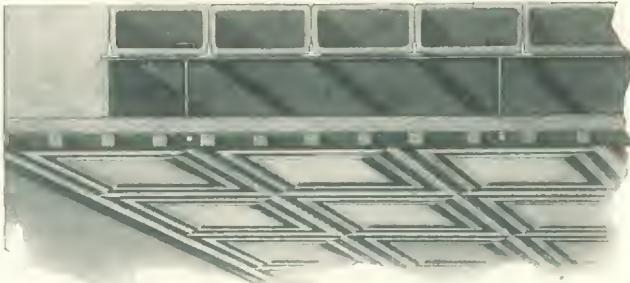

If rooms contain beams that must be covered, add for them as follows:

Our quotations and estimates will always include all sheet metal shown in the design specified, with one wood bracket cut to the profile of the cornices and moldings at

each lapping joint. The shipping weight of "Invisible Joint" Steel Ceilings is 60 lbs. per 100 square feet, crated. Accepted at fourth-class transportation rates.

Methods of Applying Metal Ceilings To Concrete Construction

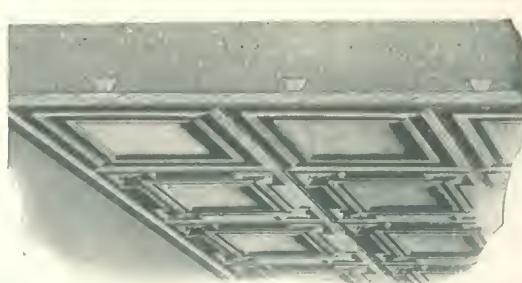

Method No. 1

There is a growing demand for "Invisible Joint" Metal Ceilings for Cement or Concrete Buildings, especially in factory offices and show-rooms. Stucco designs, which are in architectural harmony with the cement work, are generally recommended. These ceilings are much less expensive than ornamental plaster work, fully as artistic and more dependable. Three methods of applying same are here shown.

Method No. 1

shows application of metal ceiling to building with concrete beams and book tile ceiling or roof. Toggle bolts are used to fasten the rods to the tile. $\frac{1}{8}$ by $1\frac{1}{4}$ -inch furring strips are fastened to these bolts to suspend the ceiling the proper height and regular furring strips applied crosswise, either 6 or 24 inches on center, according to the design. See illustration above.

Method No. 2

Method No. 2

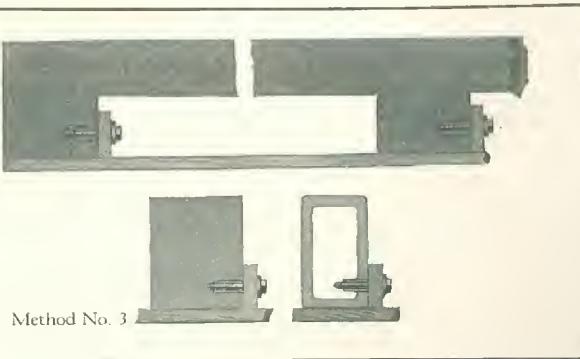

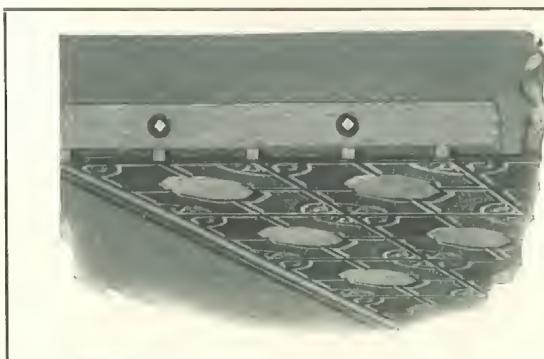

shows application of metal ceiling to concrete keyed wood strips, imbedded in the concrete when the floor is poured. $\frac{1}{8}$ by $1\frac{1}{4}$ -inch wood strips are nailed crosswise to the keyed strips, either 6 or 24 inches on center, according to the design.

Method No. 3

No. 3 shows method of attaching metal ceiling to the concrete beams. By this method high ceilings can be brought down even with the bottom of the beam.

Send Us Plans

and we will submit blueprints showing the best method of covering. We have made a study of this subject, so can furnish complete plans and practical information.

Method No. 3

Methods of Measuring Rooms for

"Invisible Joint"
TRADE MARK

Metal Ceilings and Sidewalls

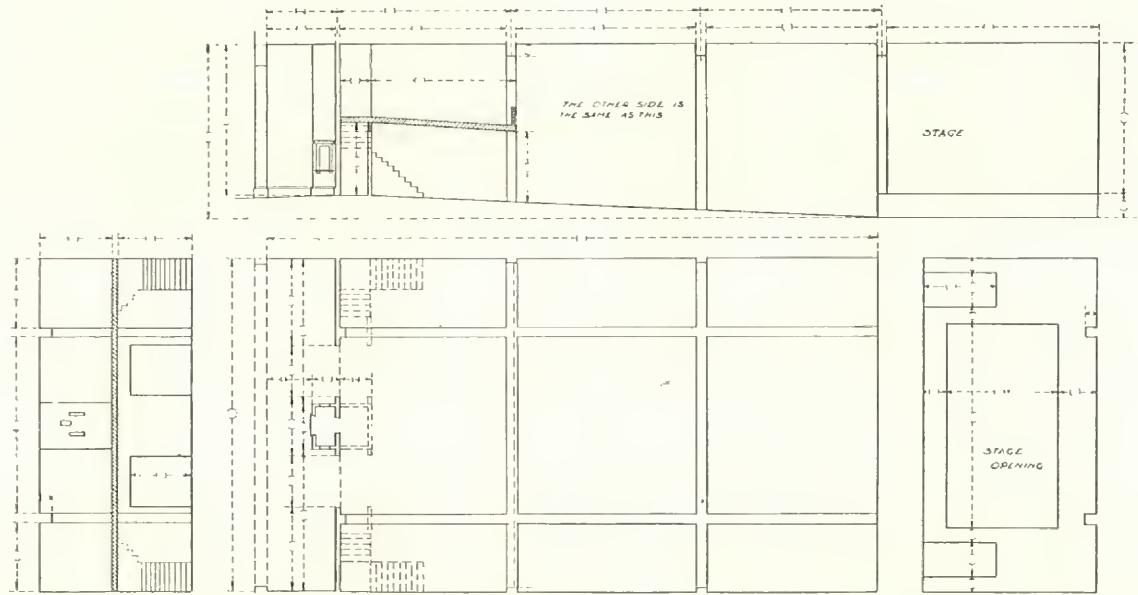

The diagrams below and on the following page indicate the various measurements needed for different styles of ceilings. Decide as to which class your room comes in, then fill in exact dimensions for all spaces as indicated by the parentheses (...). By following these fundamentals in making your measurements you will aid us in arranging appropriate combination designs. In case the room, for which you want the metal ceiling or side walls, does not conform to any of these five standards, give us complete details with blueprint if possible and we shall be glad to work out the complete estimate for you.

When sending in measurements for metal ceilings or sidewalls, include a

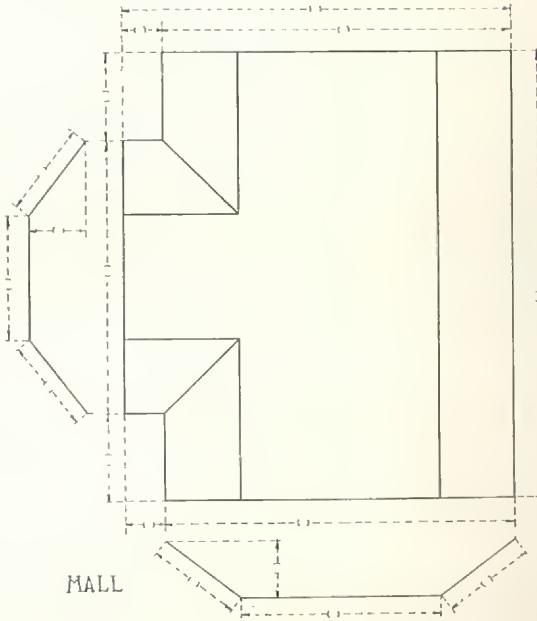

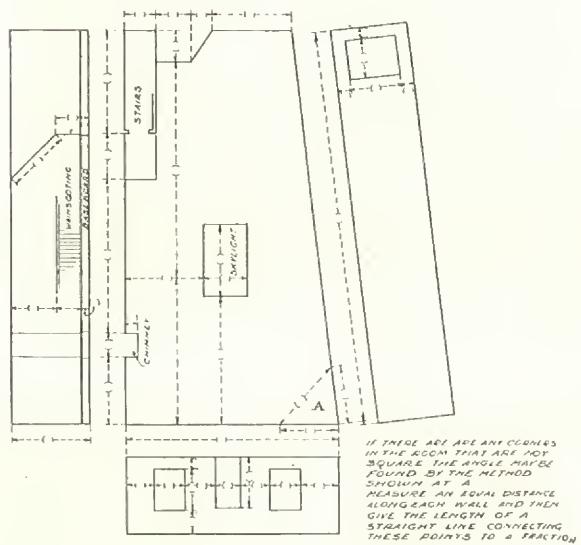

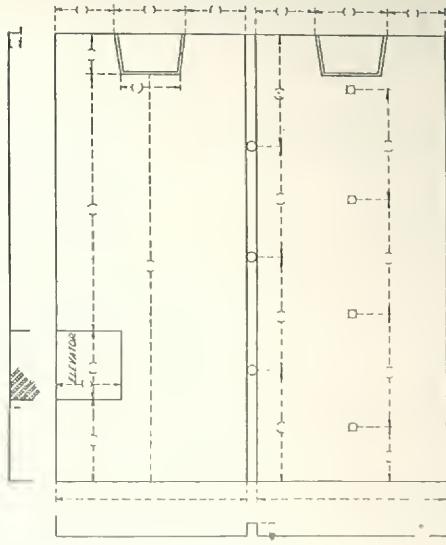

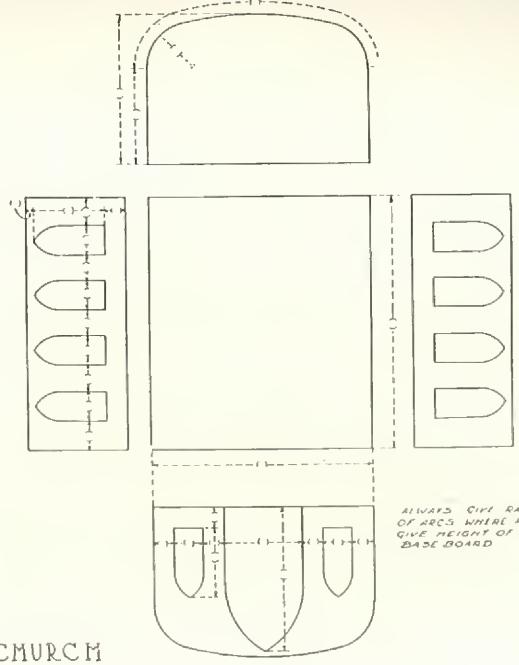

simple outline to indicate the shape and dimensions of the room. Drawings do not have to be made to scale—just give exact measurements. Of course, if you can send exact blueprints, do so, as they are more convenient for us to work with.

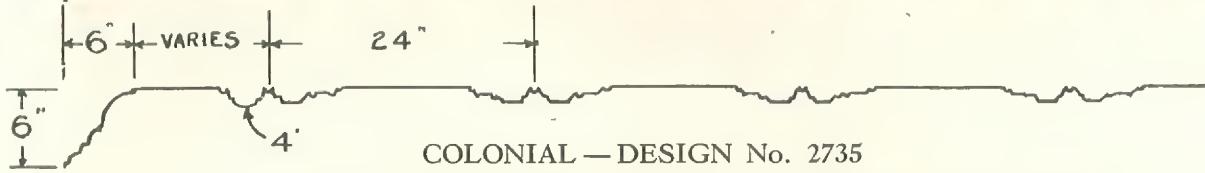

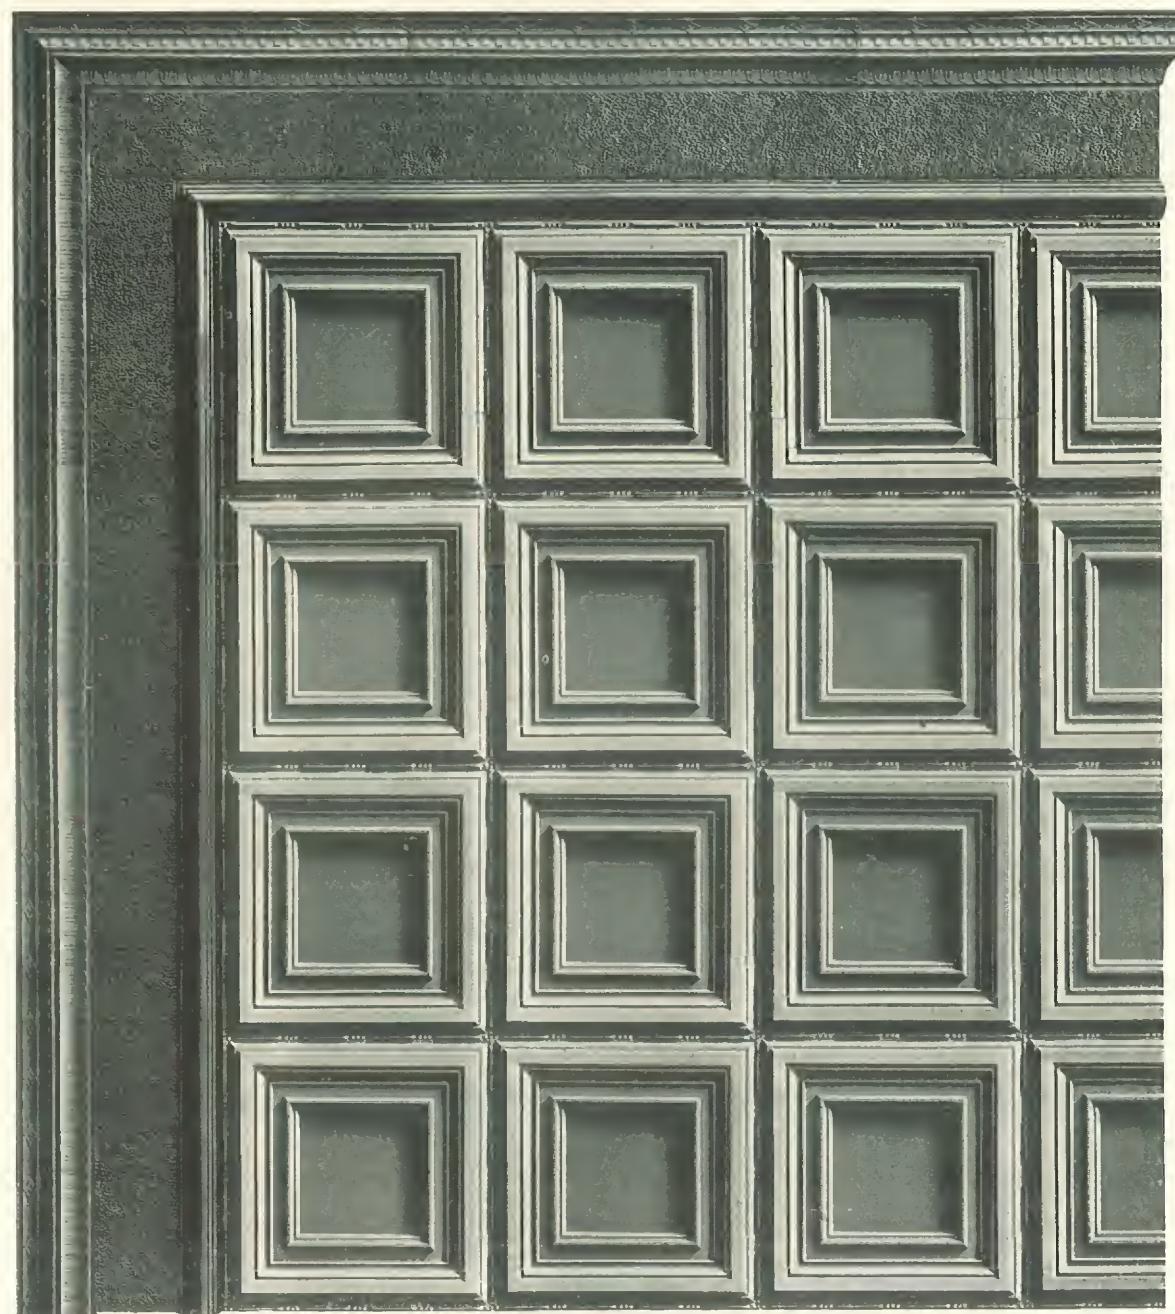

Be sure to indicate the exact size and location of all offsets, such as chimneys, elevators, skylight openings, beams and stairways. State whether or not cornice may be used across front of room.

When estimating, do not make any deductions for skylight openings of less than 100 square feet, nor for stairways, chimneys or other openings or projections of less than 50 square feet.

THEATER

COLONIAL — DESIGN No. 2735

A beautiful, conservative Flush Back pattern, which meets the modern tendency toward simplicity

Lock-Joint Plain Steel Tile

Lock-Joint Plain Steel Tile and Trimmings are ideal for finishing walls of Bathrooms, Kitchens, Vestibules, Restaurants, Barber Shops, Lavatories, etc., because these metal walls not only look neat and clean, but actually *are* the most sanitary type of construction available. They can be more easily cleaned than any other wall finish. They remain fire-safe and crack-free; they are unaffected by steam, changing temperatures or excessive moisture. They weigh less and cost less than vitreous enameled tile and can be much more easily installed. These metal walls will outlast the building itself.

Milcor Plain Steel Tile should be erected on boarded or flat surfaces only, to insure a smooth, true tile effect. The sheets interlock so that no seams are visible. Outside and inside corner pieces are furnished as shown below.

Plate No. 2602. 6 x 6 inch Pattern

A Lesson in Safety!

SAFETY and Economy! Wherever a new school building is going to be erected or an old one is to be remodeled, the facts of the following and other sad and expensive experiences should be considered:—

The taxpayers of Merton, a small Wisconsin town, built a beautiful new school five years ago—15 rooms and a gymnasium. Walls and ceilings were plastered on wood lath. After two years, the plaster began to loosen and fall. Teachers and children were in constant danger of being killed or crippled by heavy blocks of falling plaster. Although new, the school was unsafe, unsightly, insanitary!

During the summer vacation period of 1926, all ceilings throughout the building were replaced with "Invisible Joint" Metal Ceilings. Merton is now satisfied. Its school at last is safe—and will remain so. The School Board is well pleased. The Superintendent of Schools and the Industrial Commission have commented favorably on the safety, neatness and expert erection of these metal ceilings.

The moral of this lesson is plain. Investigate Invisible Joint Metal Ceilings BEFORE building or remodeling.

"Invisible Joint"
TRADE MARK

METAL CEILINGS

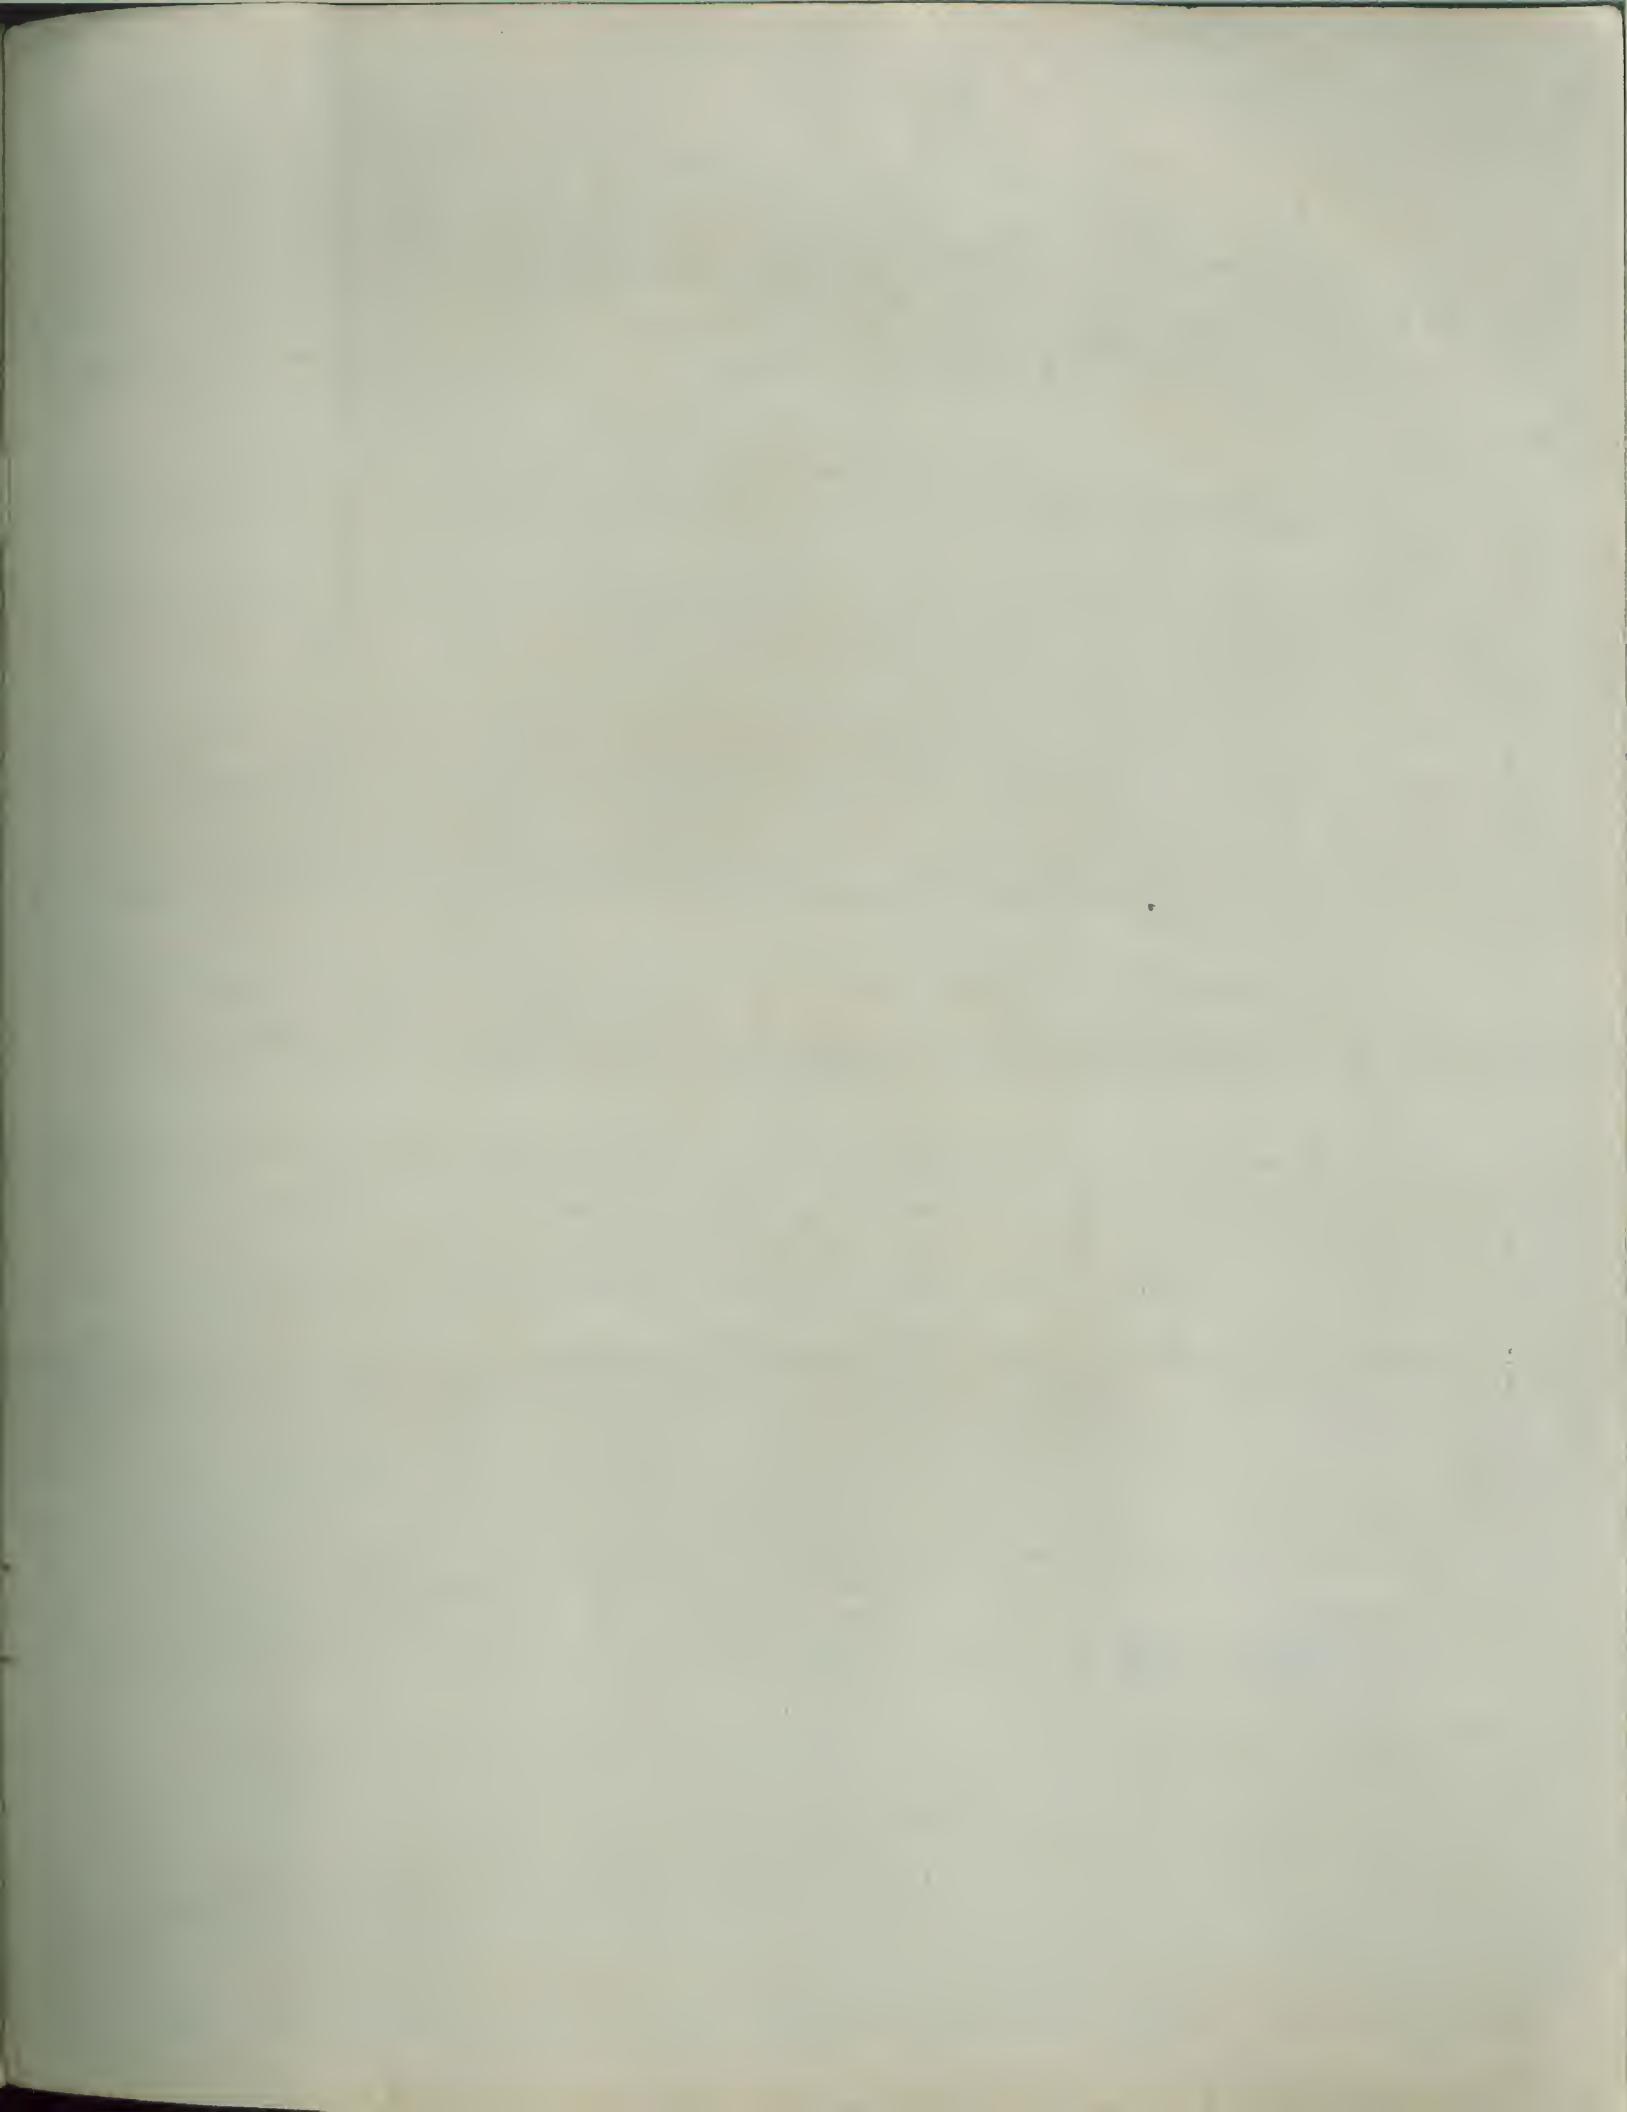

Avoid this!

Instead of the danger of falling ceilings, unsightly rooms, fire hazards and undue expense, "Invisible Joint" Metal Ceilings & Walls offer these advantages:

1. Permanently firesafe.
2. Cannot crack, shrink, warp, or fall off.
3. Easily applied; once on, they stay on; nothing to work loose.
4. Economical, durable, everlasting.
5. Sanitary; cannot absorb dust, moisture or germs.
6. Unparalleled for beauty and permanence.
7. Waterproof, dust proof, vermin proof.
8. Easily cleaned with soap and water.
9. Easily, economically refinished; require less paint than any other type of interior finish.
10. Vibration, jolts or jars or settling strains do not affect them.
